

ABSTRACT:

The invention relates to a torque support on oil collecting receptacles (2, 2') in a region of a paired connection of spindle heads and roll necks (1, 1') in rolling mill stands during adjustment thereof in both vertical and axial directions, with a respective attachment point on both upper and lower collecting receptacles (2, 2'). The new torque support consists of a one-piece strip (3) having, in particular, a rectangular cross-section and formed of flexion-resistant material, and which is pivotally connected at an upper end with the upper oil collecting receptacle (2) in a vertical plane by an articulated joint (4) and, in a region of its lower end (9), is slidably guided in the pendulum plane in formlocking compatible opening (5) of a guide link member (6) so that the distance and the inclination angle (α) change.
